The optic sulci (grooves) are the first parts of the eye to develop at the cranial pole of the embryo. Protrusion of the optic grooves coincides with embryonic folding, as the edges of the neural folds begin to come together. As they continue to grow outward from the primitive diencephalon, the optic grooves form the optic vesicles, which is continuous with the forebrain cavity.

The cerebellar vermis (from Latin vermis, "worm") is located in the medial, cortico-nuclear zone of the cerebellum, which is in the posterior fossa of the cranium. The primary fissure in the vermis curves ventrolaterally to the superior surface of the cerebellum, dividing it into anterior and posterior lobes. Functionally, the vermis is associated with bodily posture and locomotion.

### Cerebellar vermis - Wikipedia

Medical Histology is the microscopic study of tissues and organs through sectioning, staining, and examining those sections under a microscope. Often called microscopic anatomy and histochemistry, histology allows for the visualization of tissue structure and characteristic changes the tissue may have undergone. Because of this, it is utilized in medical diagnosis, scientific study, autopsy ...

### Practical Murine Hematopathology: A Comparative Review and ...

Anatomy and physiology are two related biology disciplines. Many college courses teach them together, so it's easy to be confused about the difference between them. Simply put, anatomy is the study of the structure and identity of body parts, while physiology is the study of how these parts function and relate to one another.

### Difference Between Anatomy and Physiology

Microscopic anatomy is further divided into the exploration of the histological and cytological studies. Cytology is the branch of microscopic anatomy that studies the cells and histology is the branch of microscopic anatomy that studies tissues. From the smallest to the largest part of the human anatomy, in that sequential order, are the: Cells
